Sprint 1 Reflection

In sprint 1, as our team focused on developing the initial pitch for our start-up idea, I contributed as a developer by generating ideas and researching potential problems to address with a practical solution. One of the first helpful steps came from our professor, who encouraged each team member to come up with at least two ideas to present to the group, which made everything easier. One of my ideas, which the team ultimately selected, was the daily word generator aimed at helping people build their vocabulary skills. We named the project Daily Logos, and I was excited to contribute to its conceptualization and initial development.

My part for the sprint was to work on the introduction on introducing our project and inviting people to understand our idea, and what the goal of the project will be. I addressed the problem by highlighting that there is always room for improvement in vocabulary-building skills. While our main audience consists of students and professionals, we intentionally designed the project to be accessible to anyone who could benefit from improving their English, which is one of the most widely spoken languages in the world. I focused on outlining these details in the project pitch and review, ensuring that the purpose, potential impact, and feasibility of the project were clearly communicated. Additionally, I served as a developer, tester, and documenter, helping to set up the Java project structure on Visual Studio Code, integrate it with GitLab, and maintain organized documentation to support a smooth workflow.

One of the challenges I faced individually was aligning our schedules and managing time effectively. With each team member balancing different classes and responsibilities, it was sometimes difficult to coordinate meetings and collaborate efficiently. To solve this, I suggested specific meeting times, focused on tasks I could do on my own, and shared detailed notes with the team. This taught me how important planning, time management, and flexibility are when working with others.

During this sprint, I learned several new skills and insights. I gained experience with setting up a Java project in VS Code and using GitLab to manage our code. I also learned how to organize my work, document my progress, and communicate ideas clearly in a project pitch. Additionally, I improved my ability to plan my tasks and manage my time while balancing team responsibilities.

In the next sprint, I could improve by documenting my work more clearly and keeping better track of ideas and tasks. I also think the team could benefit from setting regular check-ins and clearer deadlines to help everyone stay on track. Improving

communication and planning ahead would make collaboration smoother and reduce last-minute issues.
