Reflection

During this sprint, I primarily focused on two tasks: creating the Call-to-Action slide for the pitch and developing a straightforward plan for moving forward as a team. It also gave the team something real to respond to instead of just talking about ideas in general. I suggested that we create a one-page MVP (with daily words, basic streaks, and a simple educator view), turn that into a few small user stories with acceptance checks, and set up a short pilot so we can make sure it's useful before we add more features. Scope and alignment were the hardest things for me. We had a lot of great ideas, but it was easy to get into "nice-to-have" mode. I tried to keep us on track by setting time limits for discussions and giving each step a success signal. It was also hard to get feedback quickly on the design because I didn't want to overbuild the visuals. So I shared an early draft and asked for very specific comments on the tone, clarity of actions, and whether the "proposal" message got through. I also learned that a proposal sprint is very different from a build sprint. When I wrote the pitch, I had to think about how to frame the problem, what the audience needed, and what value I could offer without hiding behind features. I practiced cutting language down to what matters (who it helps, how it helps, what we want them to do next) and making sure that every slide fits with the grading rubric. Next sprint, I'll make our planning and rehearsal loop stronger. I'll post a one-page sprint plan and a shared Q&A bank. Then I'll do two timed test runs and record feedback to improve the pacing, transitions, and slide clarity. We'll put a rubric traceability header on each slide (for example, "Addresses: Problem, Audience, ") and a checklist to make sure everything is accessible.
