Sprint 2 Reflection Andrew Kim

During the 2nd sprint, I created the React folder and the Firebase database for the project and deployed it to Firebase to get a working web app. I also created the authentication part with the signin, signup and signout functions. The most difficult challenge I had during this sprint was actually learning how to create everything and code the things for the database. I looked through a couple youtube videos on how to set things up and install many things like Node.js and Firebase tools and React and also looked up basic tutorials on how to do things. It felt like I was learning a new programming language and it was a hard time. Even though I only knew very little, the tutorials showed me the few parts I do need without really understanding the whole concept and things behind everything. If I had known a lot sooner that I was going to be using Firebase and React I might have looked into it sooner to be a little more prepared for taking on this project but for the little time I had I did what I could.
Another issue that came up specifically for me was that I had an issue where my react folder was not pushing to the gitlab for a bit and only found out once I deleted the project folder from my computer. No one told me about this until I cloned it again thinking it would fix my issue which was when I learned nothing was pushed. Thankfully I recovered some files but others I had to recreate which wasn't great. It was my issue but I learned I should properly commit things and if nothing gets pushed then there's an issue. It could have been better if I had just been more careful and not so reckless when using git. I also could have probably asked one of the group members to check if there was anything there but I was reckless and panicked.
