Personal Reflection – Sprint 2

Euphrata Teshome

During Sprint 2, I contributed to setting up our project's backend connection and helping our team stay organized. One of the biggest moments for me this sprint was meeting with our professor, who gave us guidance on which technologies to use. At first, our team didn't have a clear idea of how to connect the frontend and backend for our web app. During the meeting, our professor suggested using React for the frontend and Firebase for the backend and hosting. His advice really helped us find direction and confidence in how to approach our project.

After that meeting, I personally spent time researching both Firebase and React, since I didn't have much experience with either of them before. I watched tutorials, read documentation, and experimented with examples to understand how authentication, hosting, and routing worked. This research helped me learn how to connect Firebase to our React app and how to use Firebase Authentication to manage user sign-in and sign-out.

I worked on setting up Firebase Hosting to make sure the project could be deployed live. I also helped organize and track the team's work using ClickUp, which helped everyone stay aware of their assigned tasks and overall progress. Other team members focused on React routing, building the authentication form, and testing the sign-in/sign-up flow.

Throughout this sprint, I learned a lot about frontend–backend integration and how hosting works in real-world applications. Before this sprint, I didn't have much experience connecting a web app to a backend or deploying it online. Now I feel more confident in using tools like React, Firebase Authentication, and Firebase Hosting. I also learned the importance of planning and communication in teamwork—especially when multiple people are working on connected parts of the same project.

For the next sprint, I think I could improve by documenting each step more clearly as I work, so others can easily repeat the setup or troubleshoot issues. As a team, we could improve by meeting more consistently outside of class to check progress and test the app together. Overall, Sprint 2 helped me grow both technically and collaboratively, and I feel more confident moving into Sprint 3.
