Sprint 3 Reflection Andrew Kim

During the 3rd sprint, I created the program that created a JSON file that has many words in it with their definitions using Python, NLTK, and Wordnet. I also implemented the part where the project would display the said word and the corresponding definition. When creating the program I couldn't really think of a way to get a proper word database with definitions and things like that. After doing some research I found out about Wordnet. I saw that it was a program I could use and take information from using the NLTK module and Python. Since I know how to use Python to some degree I used it to create the JSON file with the 4000 words. I assumed that a word of the day would have to have a unique word so that's why I made it have a unique 4000 words from the wordnet database. I believe that there could be a better solution but was sure that at least for a base and to have a proper working demo, this would have to be done. This temporary solution would work for 50 years if it went untouched without improvements so it would work in theory, but the bare minimum is not what we want to do, so hopefully in the next couple sprints we could improve on it. Whether or not it uses the Wordnet database or another database, it still works and there doesn't seem to be any issues with it.

I believe in the next sprint we are in a position where all we can do is wait for another meeting with the client or stakeholders because we haven't really gotten a response to our project. We have a couple user stories and ideas for features but they don't really matter if the clients and stakeholders don't find them important or useful. I personally am unsure on how to proceed without the approval of the client/stakeholder (professor). Hopefully after approval, our team can quickly make changes and appropriate work for the next sprint.
