Euphrata Teshome – Sprint 3 Reflection

During Sprint 3, the thing I accomplished was creating the history and favorites feature for our Daily Logos project. This part lets users save their favorite words so they can come back and review them later. I worked on making sure the section shows what words people liked and stored. While the team worked together on getting the daily word to show up, my main focus was on the history and favorites part and making sure it connected well to the app.

One of the challenges I faced was a pipeline issue that stopped my merge from going through. It was my first time dealing with this kind of problem, so it was confusing at first. The merge request was approved, but the build failed because of a pipeline error. I tried a few times to fix it and ended up creating a (.gitlab-ci.yml) file to help solve the problem. After trying different things and looking up what caused it, I was finally able to fix the issue and get it working again.

From this sprint, I learned how much work goes into even the smallest part of a website. Before, I didn't realize how much planning, thinking, and teamwork goes into something as simple as a button or a small feature. I also learned that errors and problems are not bad—they actually help you learn a lot more. I now understand better how the pipeline works and how builds and deployments happen in real projects.

For the next sprint, I want to improve my problem-solving skills and communication skills. I want to take more time to understand things better, be clearer when I communicate with my team, and get better at fixing problems calmly when they come up. I believe these things will help me be more efficient and confident as we continue building our project.
