Personal Reflection

In the previous sprint, I worked on learning Firebase and React, which were new to me at the time. I helped with testing and reviewing the login and authentication system that we built using Firebase. I learned how the sign-up and sign-in process works and how users are connected to the database. It was my first time working with cloud tools, so it took some time to understand how data is stored and updated, but that experience helped me a lot in this new sprint.

In this sprint, I focused more on testing and improving the new features like user history, favorites, and the dashboard. My main job was to make sure these features worked correctly after every change. I checked how the data was saving, made sure the buttons worked, and tested the navigation from login to dashboard and back. I also gave feedback whenever something did not look right or did not load properly. This helped us fix small bugs early and made the app more stable for our demo.

This sprint also brought a new member to our team, which meant we had to cooperate more closely. We needed to explain our progress, share updates clearly, and help each other understand how the project was organized. Working together taught me how important teamwork and communication are in software development, especially when the team changes.

I still faced some challenges understanding React's state updates and how Firebase connects with the frontend, but I feel much more confident now. I also learned how to test features better and use tools like the Firebase console to see what data is being saved.

For improvement, I want to manage my time better and try to work more on development tasks instead of only testing. I plan to keep practicing React and Firebase on my own, so I can contribute more coding work in the next sprint and help the team move faster.
