Sprint 4 Reflection - Euphrata Teshome

During this sprint, my accomplishment was helping transition our project from JavaScript to typescript after our team meeting with our professor. The professor advised us to make changes so that our code would be more structured, maintainable, and better aligned with modern web development practices. Following that discussion, I spent time updating the existing files and making sure the syntax and data types were properly adjusted. This process required me to review several parts of the codebase and understand how typescript handles type checking and component props differently from JavaScript

Another part of my contribution was working on the UI design for our vocabulary builder web app using Figma. I designed pages like the onboarding screen, logic, and dashboard, making sure they looked clean, consistent, and user-friendly. The design helped our team visualize how each part of the app connects before we started implementing logic. This also made it easier to communicate ideas and stay organized as a team.

Some challenges i faced included learning the new syntax and type system in typescript. At first, I ran into several errors related to missing types and file structure issues, but by reaching online documentation and watching tutorials, I was able to understand how to properly use the TypeScript interface and fix those errors. It took some trial and errors, but I learned a lot through the process.

From this sprint, I gained a better understanding of how typescripts improve code quality, as well as how UI design in Figma can help bridge the gap between the design and development process.

For the next sprint, I think I could improve by managing my time better and communicating more frequently with my teammates about any issues I run into. As a team, we could also improve our collaboration by setting clear weekly goals and dividing tasks even more evenly to make sure we grow technically and improve my problem-solving skills.
