Karan Kumar Sah
Personal Reflection – Sprint 5

This sprint, my main accomplishment was completing the entire quiz feature for our application. I focused on designing how the quiz should work, pulling words from the backend, adding rate-limited definition fetching, and making sure each quiz had ten randomized questions with shuffled answer options. I also implemented a system that tracks the user's quiz history, including lifetime accuracy, best score, and last score. Bringing all these pieces together took time and careful thinking, but I was able to complete a version that is clean, functional, and ready to expand in future sprints.

The biggest challenge I encountered was figuring out how to handle real-time definition fetching in a smooth way. Since the dictionary API can only be called one word at a time without overloading it, I had to build sequential requests with delays. I also had to work around differences in how the backend returns data. At first, this caused errors and missing definitions, but after testing different cases and adjusting the logic, I managed to make the process reliable. Debugging these issues also taught me how to better inspect API responses and handle unexpected data.

Through this work, I learned how to manage asynchronous logic more effectively, especially when dealing with multiple API calls. I also learned more about structuring React components, handling local storage in a clean way, and building a feature that feels smooth for the user. This sprint gave me more confidence in connecting the frontend to the backend and handling problems that come up as the project becomes more complex.

Looking ahead, there are areas where I can still improve. I want to organize my code more efficiently from the start instead of cleaning it up later. I also want to communicate progress earlier so that the team can plan around what I am building. For the next sprint, I plan to break down my tasks more clearly and test features sooner to avoid issues piling up at the end. Overall, this sprint helped me grow as a developer, and I am ready to build more features with better structure and clearer planning in the next one.
